

We need to store the Batch (the lifecycle of the silkworm) and the ClimateLog (the 3x-a-day entries).

Kotlin

```
import androidx.room.*
```

```
import kotlinx.coroutines.flow.Flow
```

```
// 1. Entities
```

```
@Entity(tableName = "batches")
```

```
data class Batch(
```

```
    @PrimaryKey(autoGenerate = true) val id: Int = 0,
```

```
    val breed: String,
```

```
    val startDate: Long,
```

```
    val currentInstar: Int = 1 // Stages 1 to 5
```

```
)
```

```
@Entity(tableName = "climate_logs")
```

```
data class ClimateLog(
```

```
    @PrimaryKey(autoGenerate = true) val id: Int = 0,
```

```
    val batchId: Int,
```

```
    val temperature: Float,
```

```
    val humidity: Float,
```

```
    val timestamp: Long
```

```
)
```

```
// 2. DAO (Data Access Object)
```

```
@Dao
```

```
interface SericultureDao {
```

```
    @Insert
```

```
    suspend fun insertBatch(batch: Batch)
```

```
    @Insert
```

```
    suspend fun insertLog(log: ClimateLog)
```

```
    @Query("SELECT * FROM batches ORDER BY id DESC LIMIT 1")
```

```
    fun getCurrentBatch(): Flow<Batch?>
```

```
}
```

```
// 3. Database setup
```

```
@Database(entities = [Batch::class, ClimateLog::class], version = 1)
```

```
abstract class AppDatabase : RoomDatabase() {
```

```
    abstract fun sericultureDao(): SericultureDao
```

```
}
```
